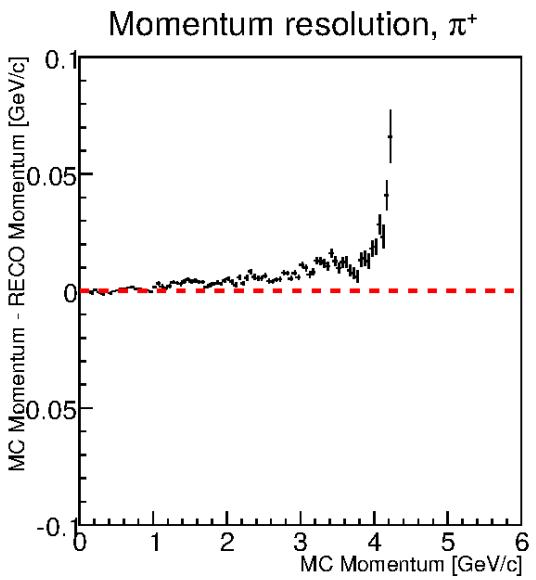
$\bar{p}p \rightarrow \bar{\Lambda}_c \Lambda_c \rightarrow \bar{\Lambda} \pi^- \Lambda \pi^+$

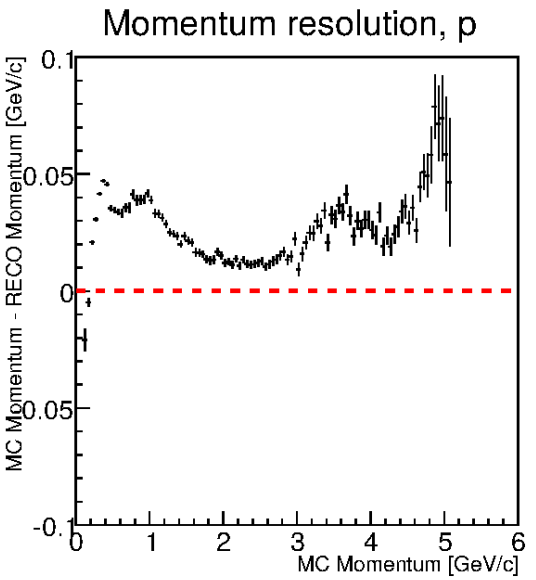
- Simulation Input
- Reconstruction of the Final State Particles
- Selection Criteria for the Λ Reconstruction
- Selection Criteria for the Λ_c Reconstruction
- Exclusive Reconstruction
- Background Considerations
- Estimated Beam Time Requirements

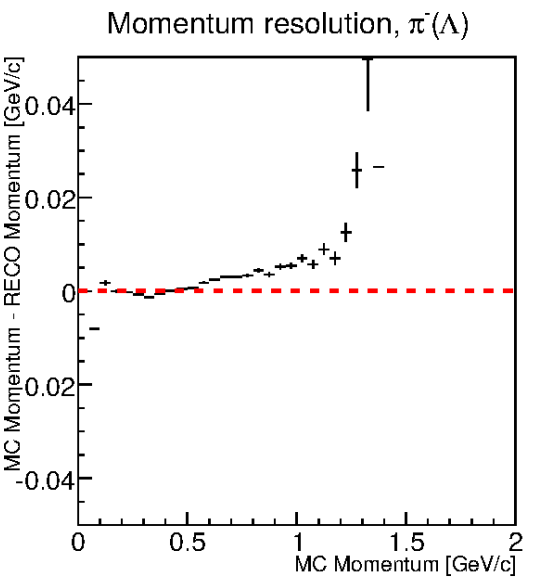
Simulation Input

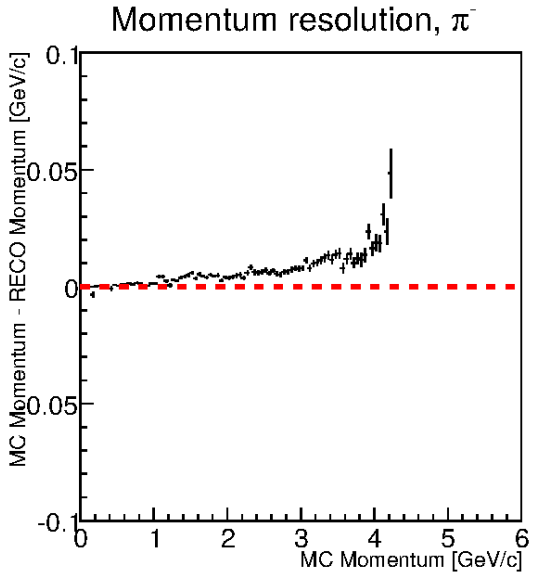
- $\bar{\Lambda}_c\Lambda_c \rightarrow \bar{\Lambda}\pi^-\Lambda\pi^+ \rightarrow \bar{p}\pi^+\pi^- p\pi^-\pi^+$
- BR=0.0107*0.639
- p_{beam}=10.2 GeV/c, $p_{threshold}$=10.16 GeV/c
- Full detector setup
- Ideal pattern recognition and ideal PID
- Only tracks with >3 hits within the same subdetector were accepted
- 798000 events have been simulated

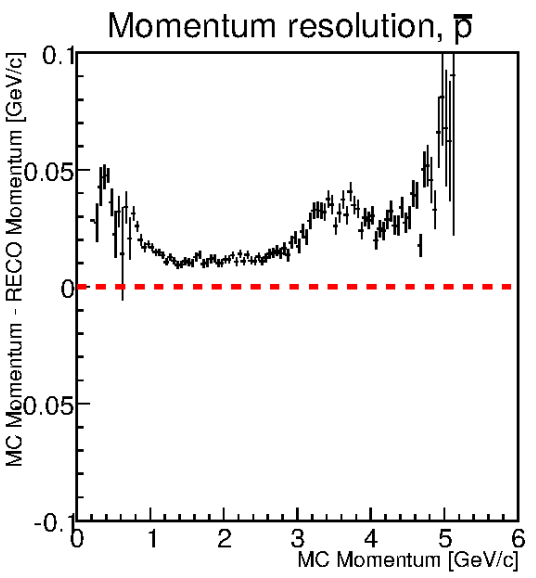
Systematic Offset in Momentum Reconstruction

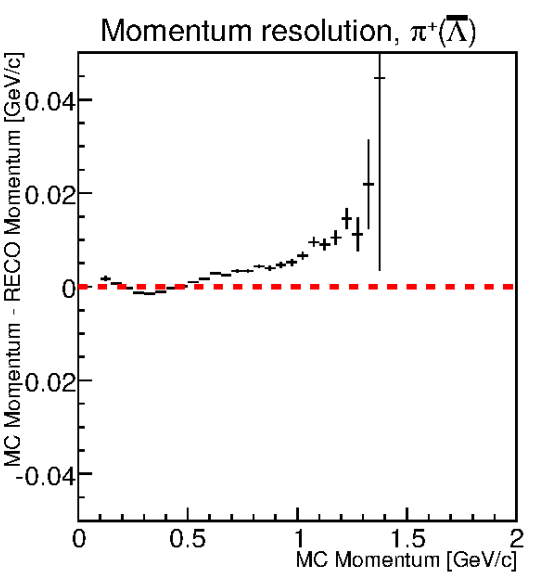




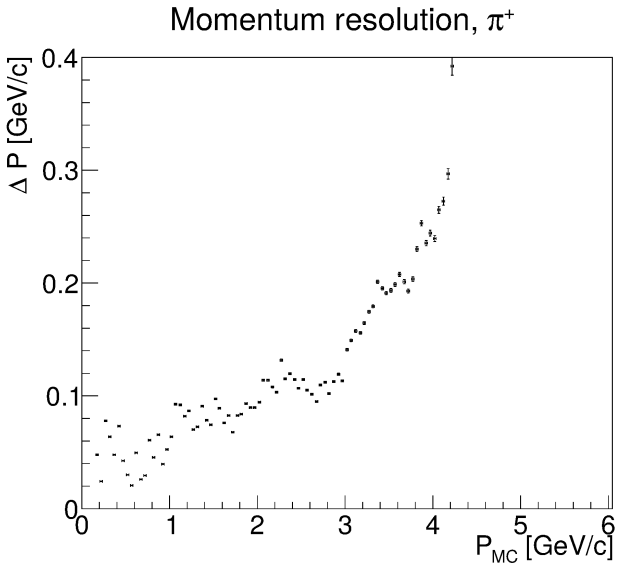


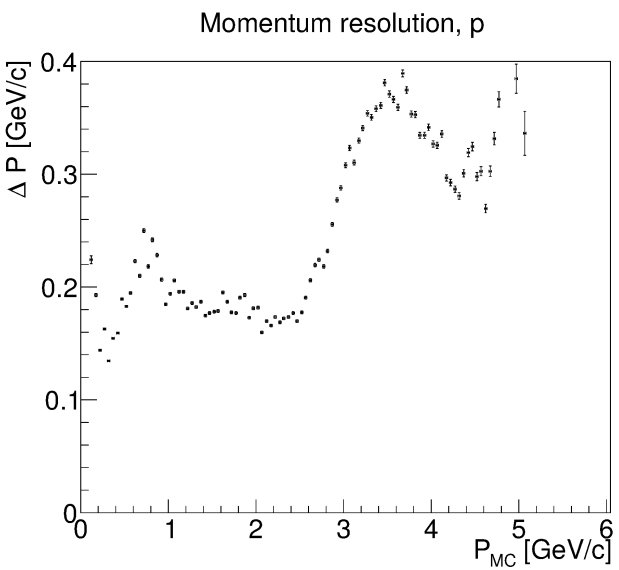


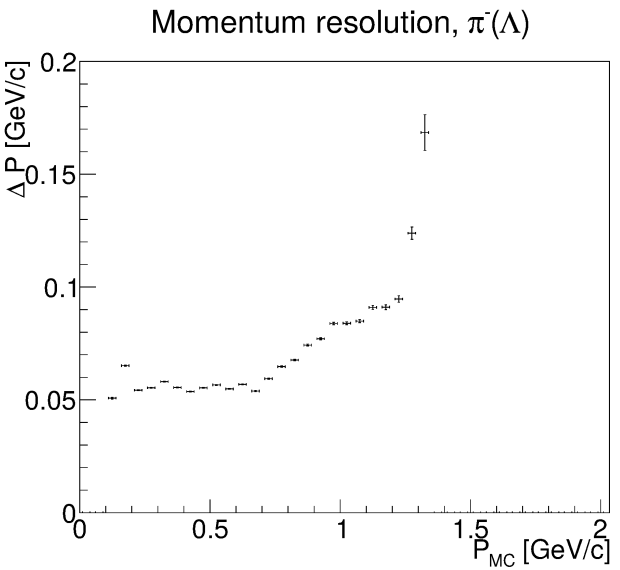


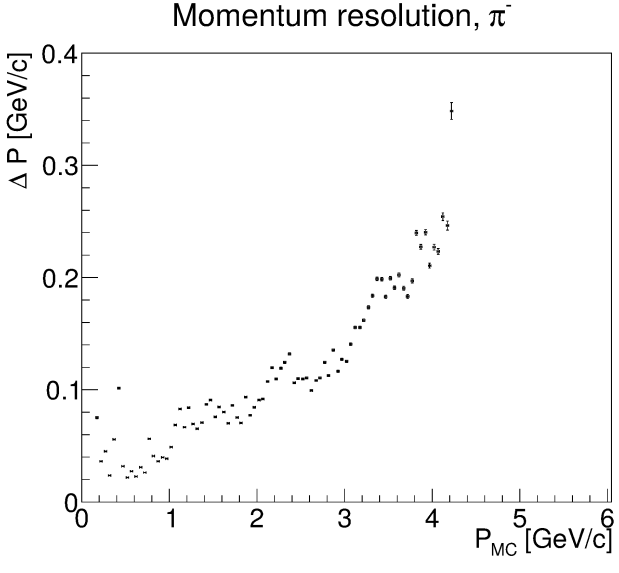


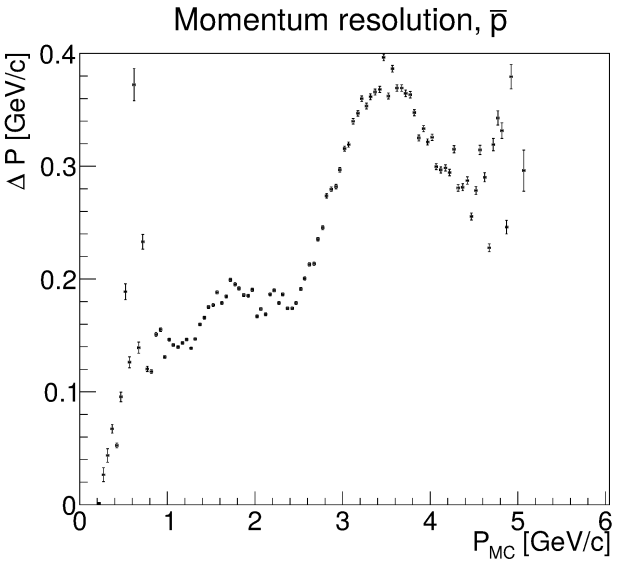
Momentum Resolution

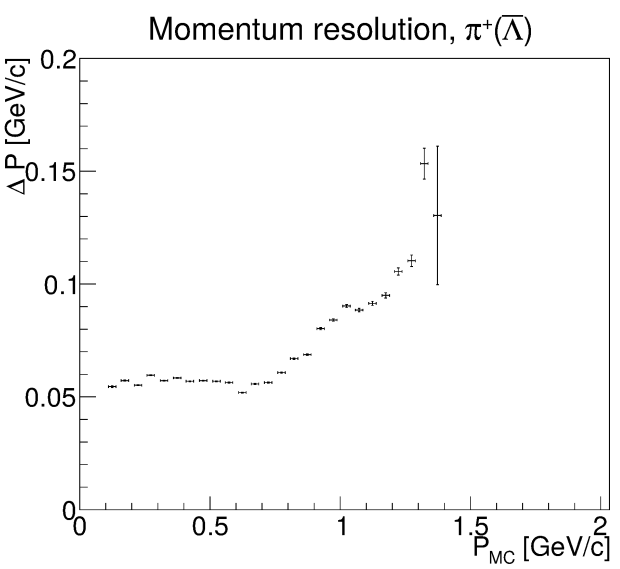












Reconstruction Efficiency

	ϵ
p	81.4%
$\overline{p}$	79.9%
$\pi^+(\Lambda_c)$	82.2%
$\pi^-(\overline{\Lambda}_c)$	83.3%
$\pi^+(\overline{\Lambda})$	75.4%
$\pi^-(\Lambda)$	75.1%

Λ efficiency: 62.3%

$\overline{\Lambda}$ efficiency: 61.4%

Λ Reconstruction

- π^- and p are combined to Λ (and charge conjugated)
- A kinematic fit with a mass constraint was applied on the candidates
- Vertex reconstruction has been performed via the Point of Closest Approach (POCA)
- The following cuts have been applied:
  - Cut on the unfitted mass
  - Cut on the fit probability
  - Cut on the vertex position (difference in Vtx distribution between signal and background)
  - Cut on PocaQA value

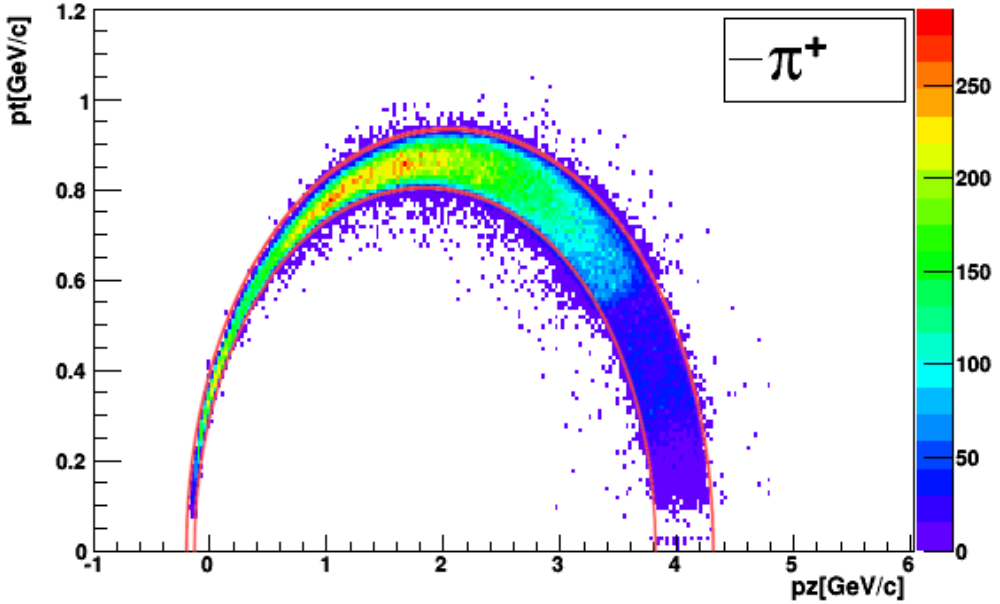
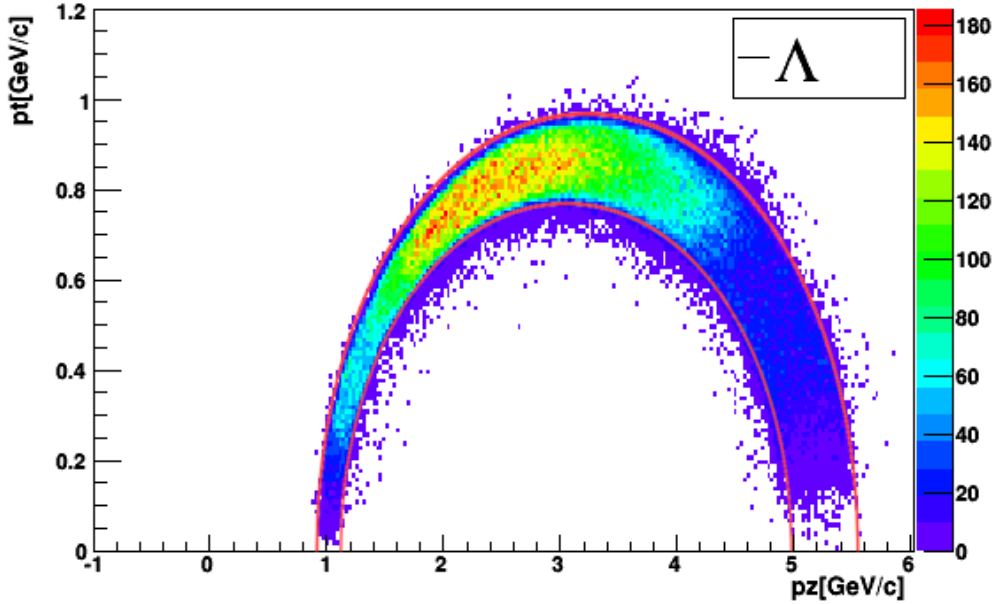
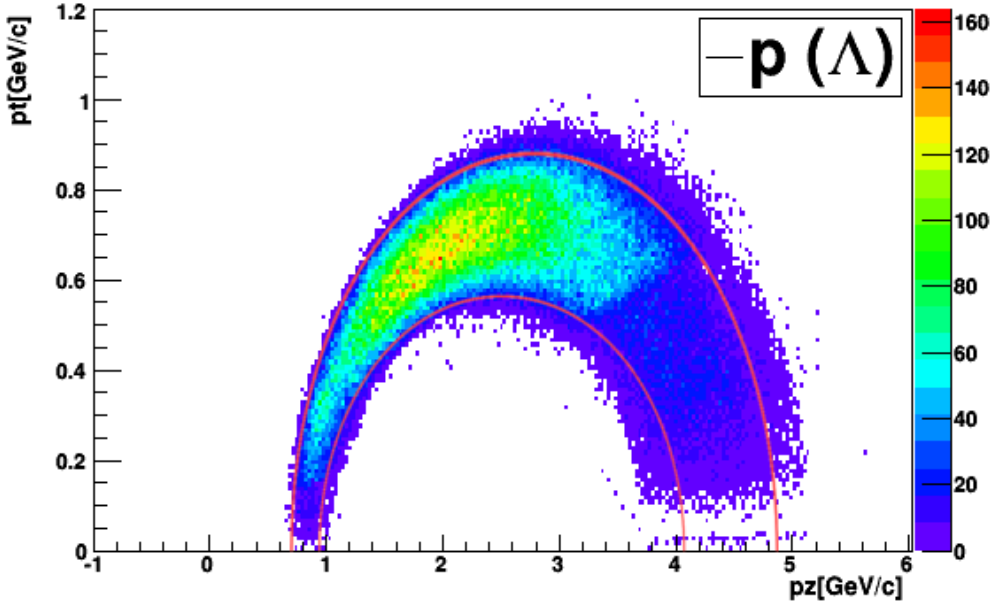
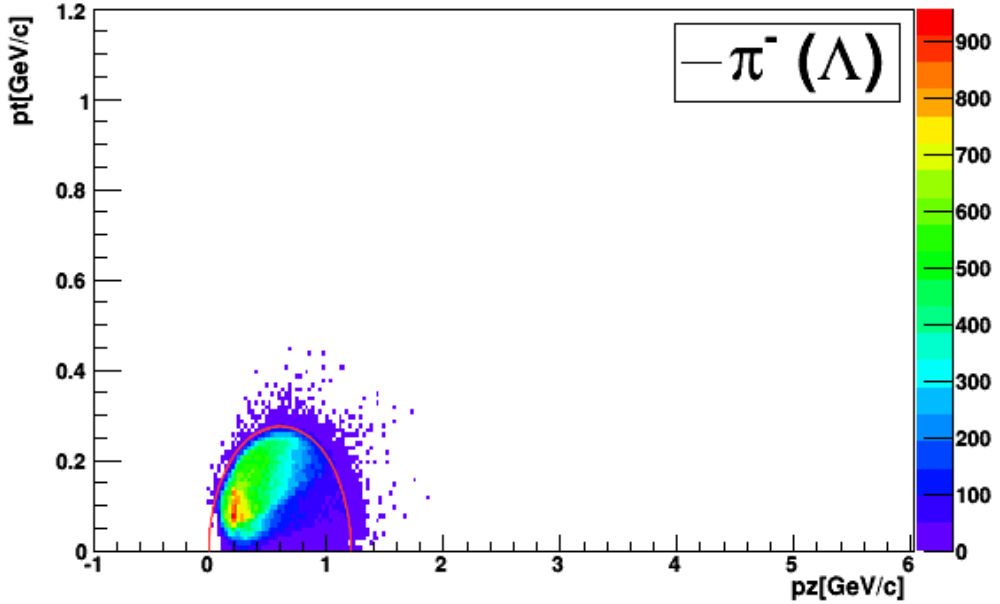
Cuts on p_t vs p_z



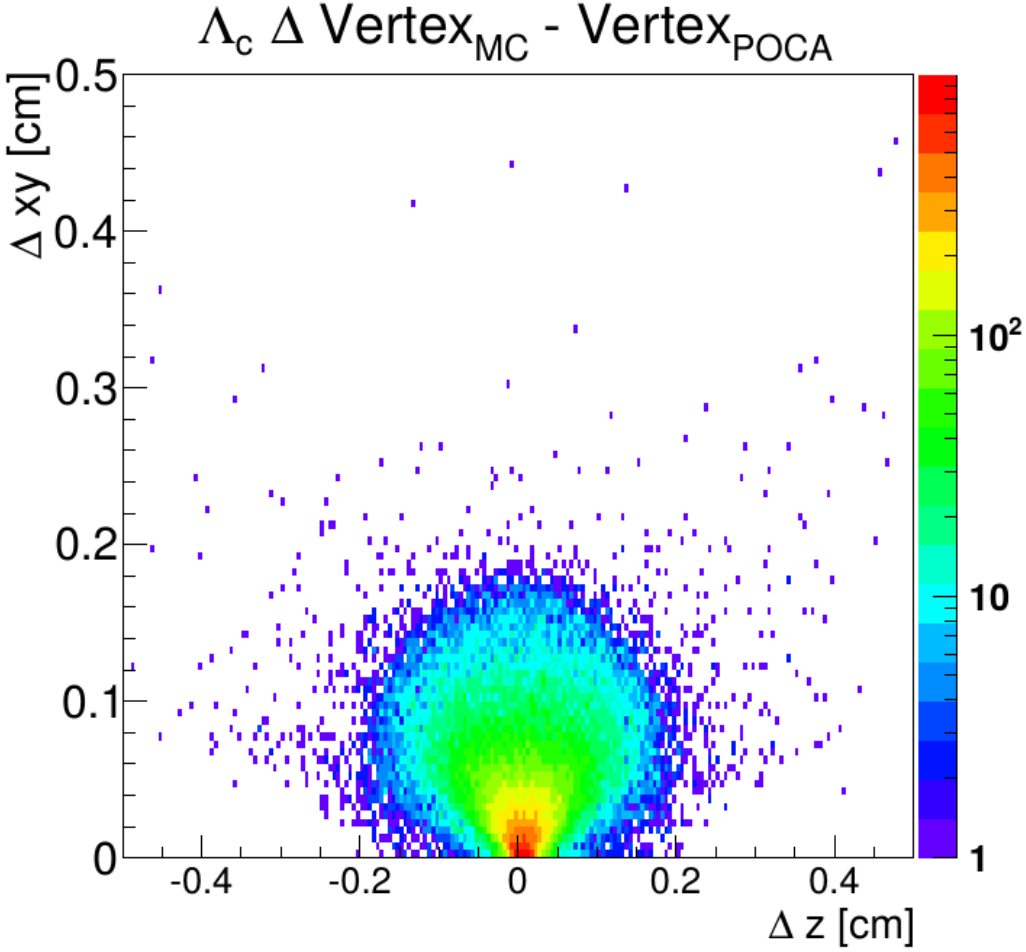


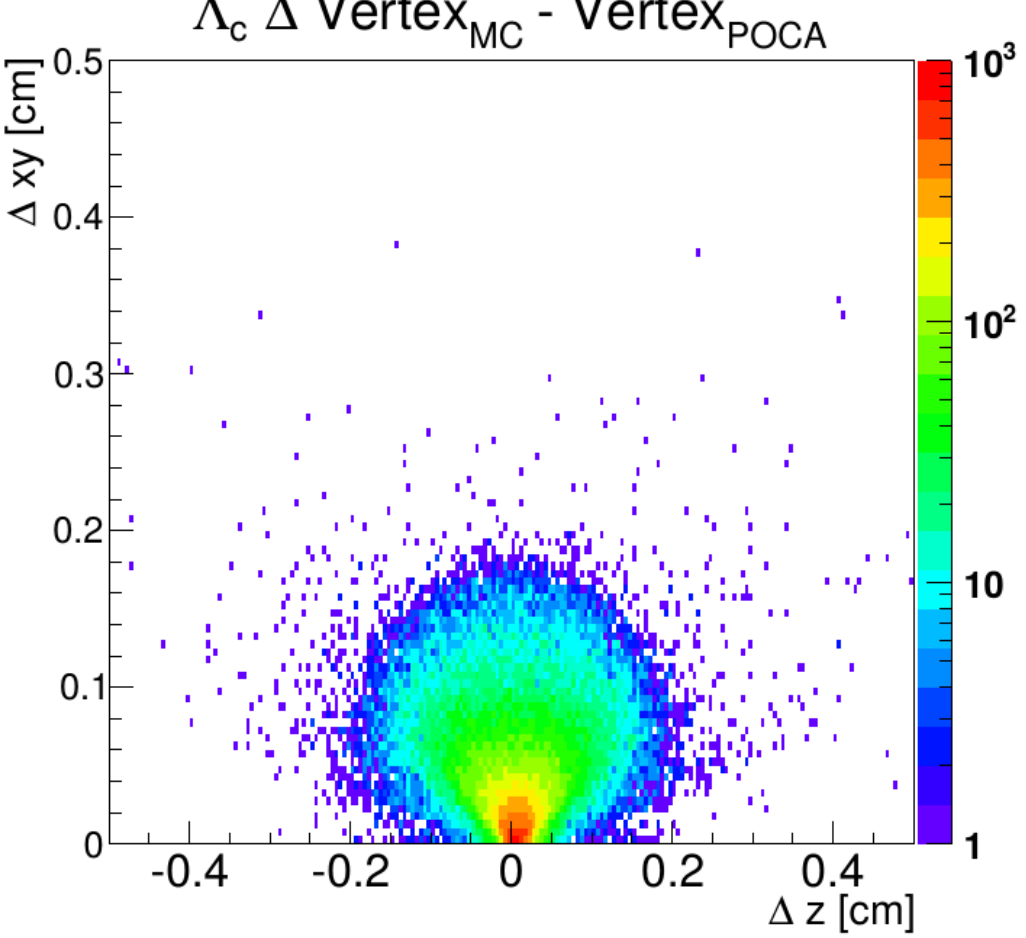




Λ_c Reconstruction

Combined π^+ and Λ form the Λ_c candidates (π^- and $\overline{\Lambda}$ for $\overline{\Lambda}_c$)





Cut on vertex position:

$$\frac{(z_{POCA} - 135\,\mu\mathrm{m})^2}{(2\,\mathrm{mm})^2} + \frac{R_{POCA}^2}{(1.75\,\mathrm{mm})^2} \leq 1$$

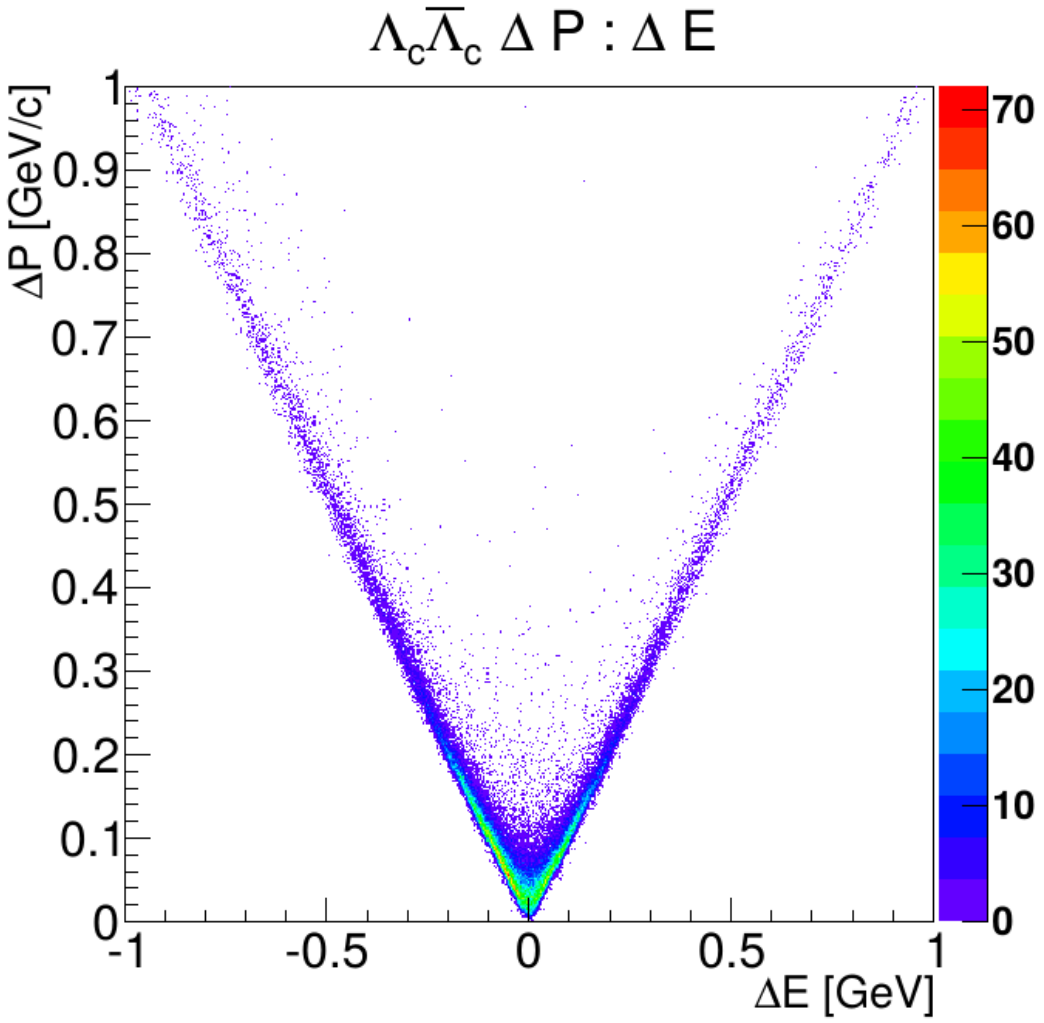
p_t vs p_z distribution

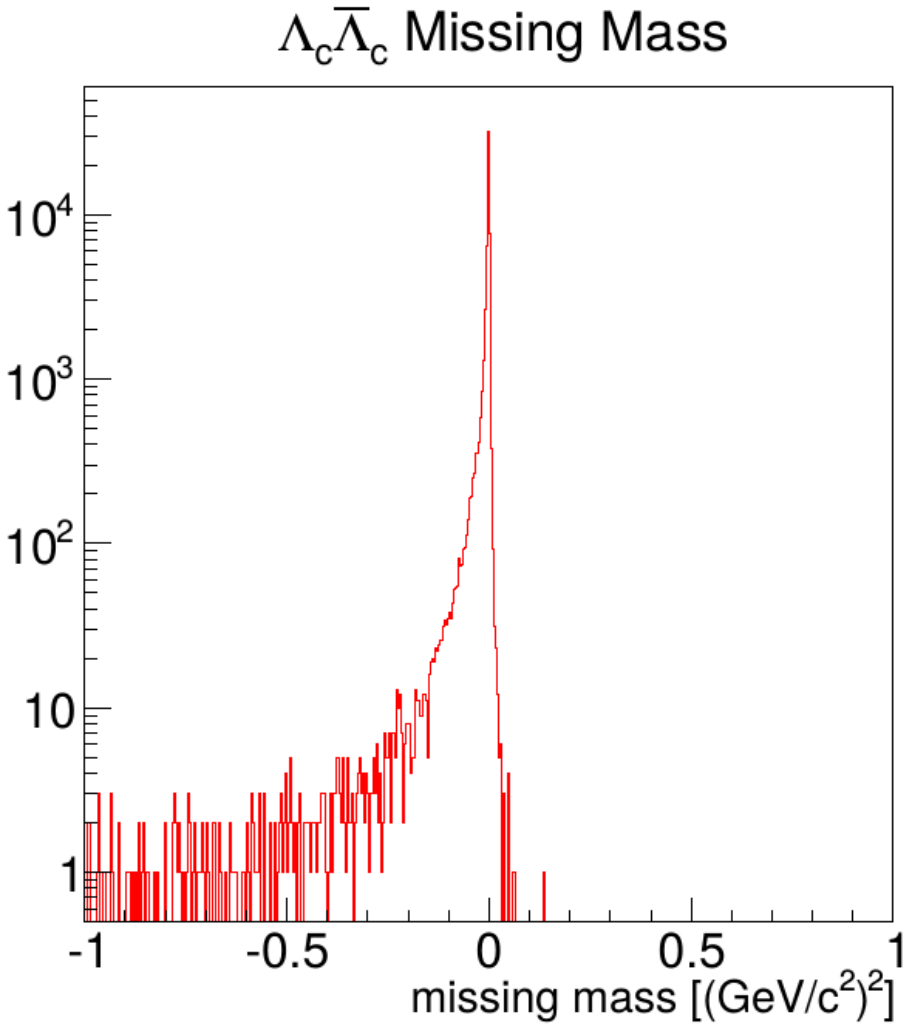
	ϵ	RMS_m	RMS_p
Λ_c	8.5 %	14.3 MeV/c^2	56.8 MeV/c
$\overline{\Lambda}_c$	8.1 %	14.5 MeV/c^2	57.2 MeV/c

Exclusive Reconstruction

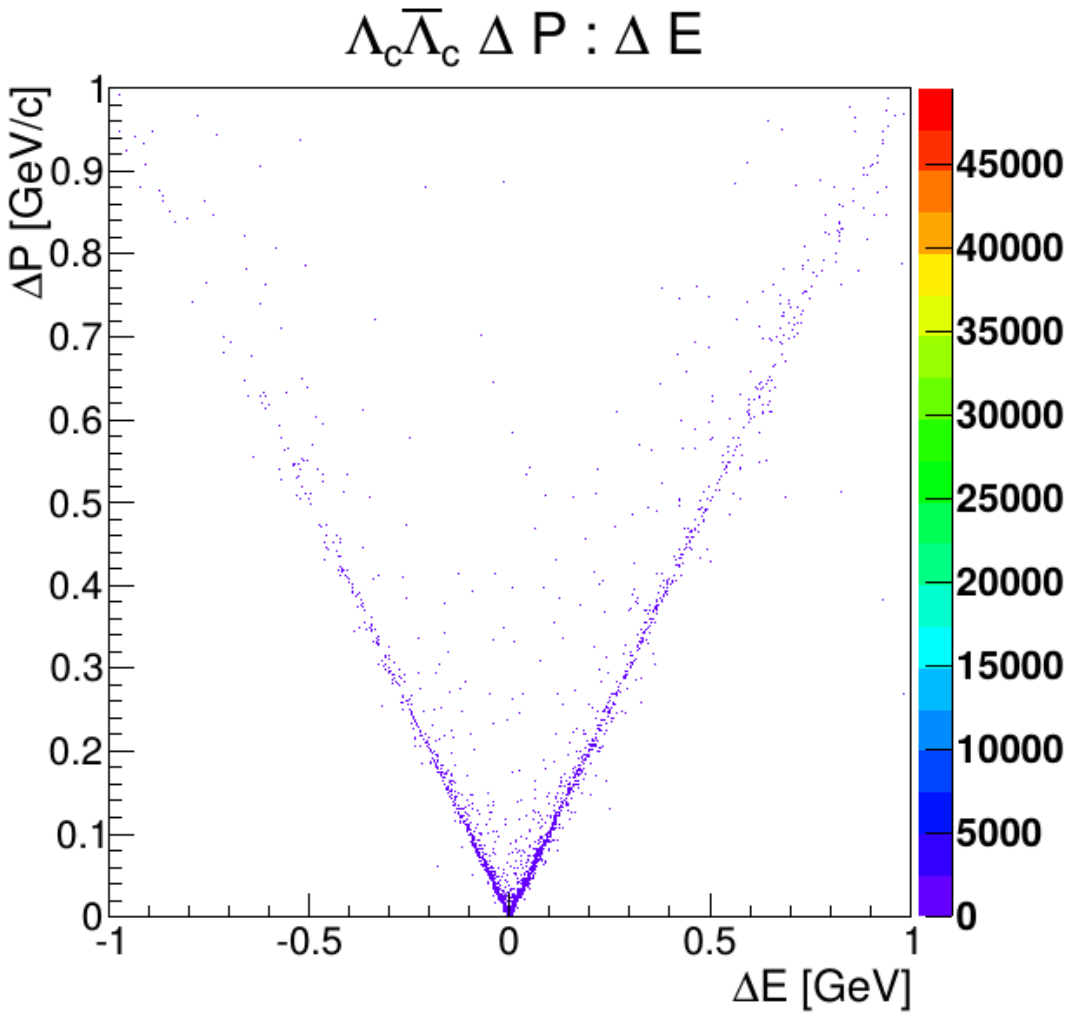
- Looser selection criteria are possible as background is surpressed by both candidates:
  - PocaQA cut at 5 cm
  - no cuts on p_t vs p_z distributions
  - no cut on the Λ and Λ vertices
- Efficiency of the exclusive measurement with those selection criteria is 6.9 %.
- Four constraint fits are possible.

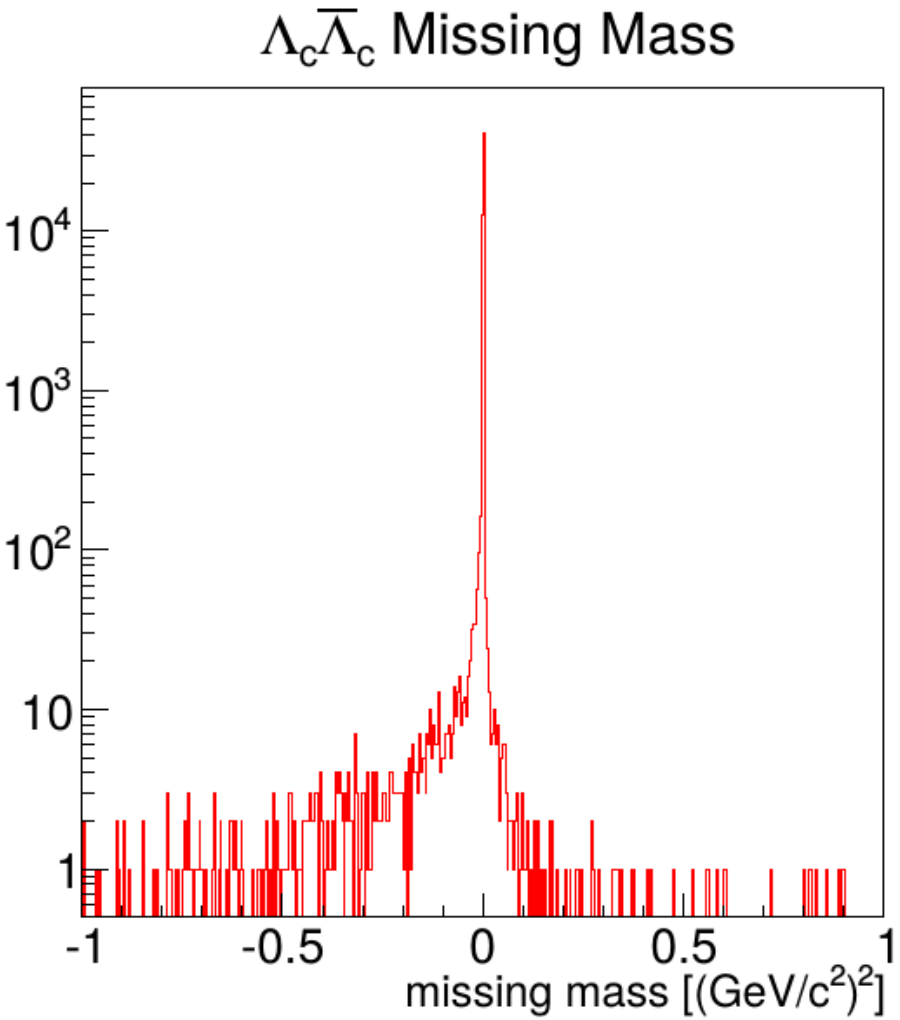
Momentum and Energy Resolution and Missing Mass





With Pnd4CFitter Applied

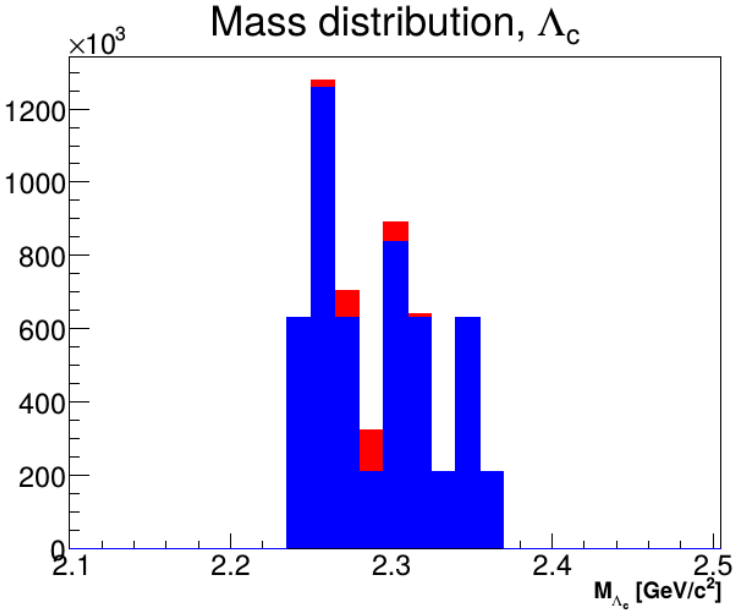




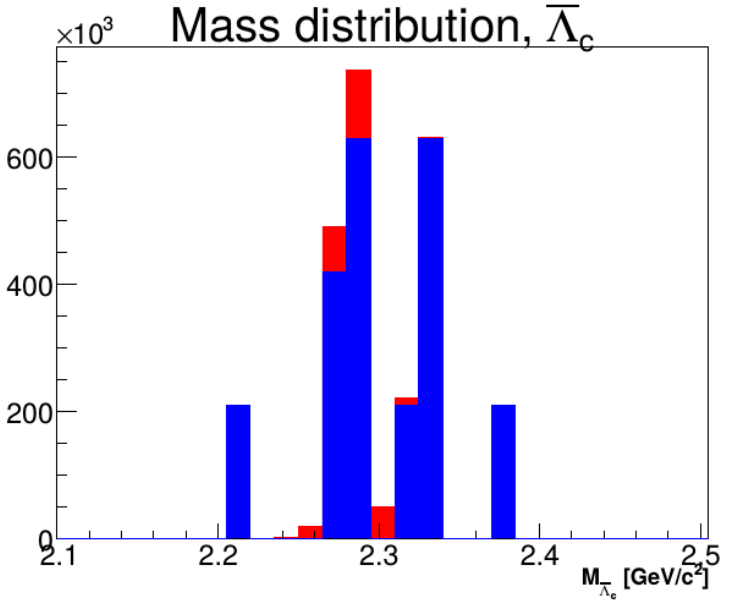
Background Considerations

- Cross section predictions for $\bar{p}p \rightarrow \bar{\Lambda}_c \Lambda_c$ range from a few nb to ~10μb.
- 235 million DPM events have been simulated with Prometeus.
- With the selection criteria shown above, 25 Λ_c and 11 $\bar{\Lambda}_c$ candidates have been reconstructed.
- None of the DPM events has been reconstructed as an exclusive event.

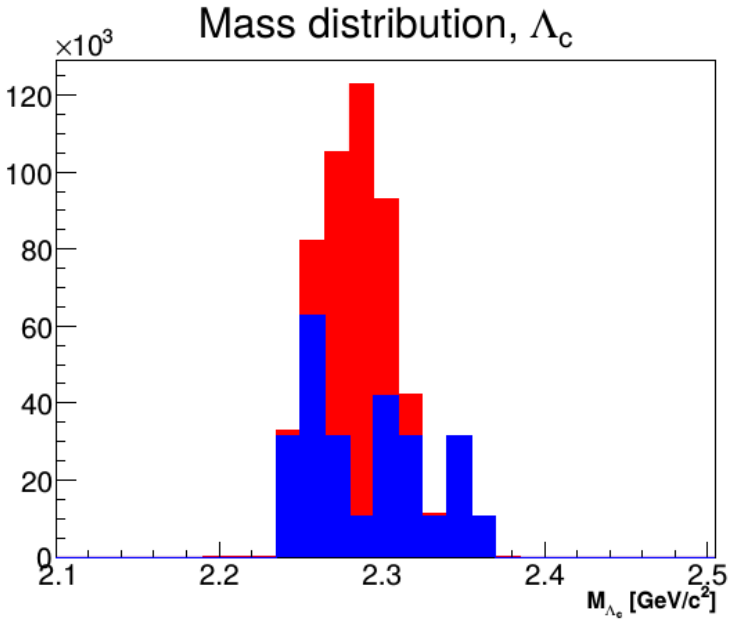
Signal to Background Comparison



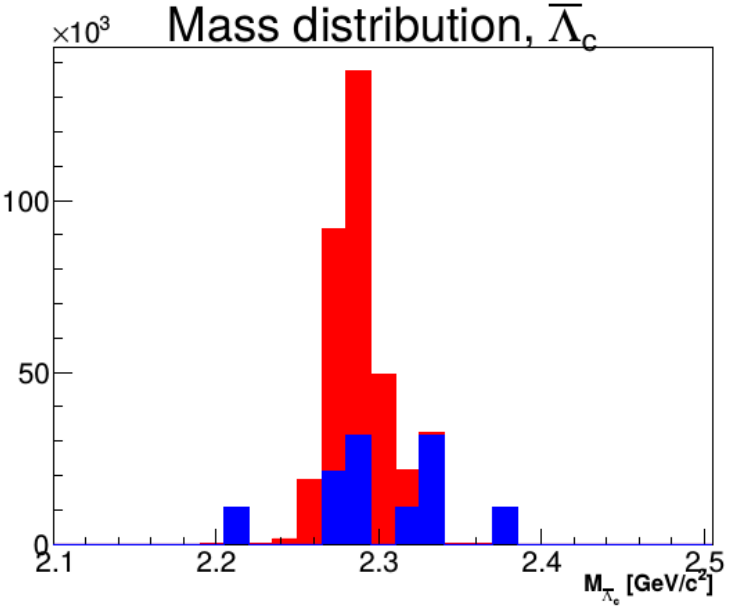
Λ_c, $\sigma_{tot} = 100\,\mathrm{nb}$



$\overline{\Lambda}_c$, $\sigma_{tot} = 100\,\mathrm{nb}$



Λ_c, $\sigma_{tot} = 2\,\mu\mathrm{b}$



$\overline{\Lambda}_c$, $\sigma_{tot} = 2\,\mu\mathrm{b}$

Beam Time Requirements

$$t_b \cdot \mathcal{L} \cdot \sigma_{p\bar{p}\to\Lambda_c\bar{\Lambda}_c} \cdot \epsilon_{\Lambda_c} \cdot \mathrm{BR} > 3 \cdot \sqrt{\mathcal{L} \cdot \sigma_{tot.} \epsilon_{bg} \cdot t}$$

$$\Leftrightarrow t_b > \frac{9 \cdot \sigma_{tot} \cdot \epsilon_{bg}}{\mathcal{L} \cdot \sigma^2_{p\bar{p}\to\Lambda_c\bar{\Lambda}_c} \cdot \epsilon^2_{\Lambda_c} \cdot \mathrm{BR}}$$

- Full luminosity is assumed $\mathcal{L} = 2 \cdot 10^{31}\,\mathrm{cm}^{-2}\mathrm{s}^{-1}$
- BR is the product of the $\Lambda_c \to \pi^+\Lambda$ and the $\Lambda \to p\pi^-$ BRs.

Estimated Beam Time Requirement

	$\sigma_{\bar{p}p\to\bar{\Lambda}_c\Lambda_c}$	$N_{\text{true}} > 3\sqrt{N_{\text{false}}}$	$N_{\Lambda_c,\bar{\Lambda}_c} = 1000$
Λ_c	5 nb	277 d	19.9 d
$\bar{\Lambda}_c$	5 nb	134 d	20.9 d
Λ_c	100 nb	16.6 h	1 d
$\bar{\Lambda}_c$	100 nb	8.1 h	1 d
Λ_c	500 nb	39.8 min	4.8 h
$\bar{\Lambda}_c$	500 nb	19.3 min	5 h
Λ_c	2 μb	150 s	71.7 min
$\bar{\Lambda}_c$	2 μb	73 s	75.2 min

The exclusive measurement ranges from 1event/3days to >100/day.

Summary

- Reconstruction of the channel is possible
- Depending on the reaction's cross section, the required beam time for a reasonable amount of statistics ranges from hours to months.
